Table 4: Descriptive statsitics of disaster preparation behaviors time 1 questions by community

Now let's perform a Cronbach's alpha analysis on disaster preparedness items - we can use the alphas if item is omitted to detect outliers.

```
psych::alpha(x = T1_DP_vars , cumulative = TRUE)

Many of the disaster preparation questions are answered 'yes' at an extremely high rate. Let's make a new variable that includes only questions where less than 95% of respondants said yes at time 1.

```
per_yes_T1$question <- as.character(per_yes_T1$question)
vars_95_less <- per_yes_T1$question[per_yes_T1$percent_yes < .95]
vars_95_less <- substr(vars_95_less, 3, nchar(vars_95_less))

Having done that, we can ask whether disaster preparedness is correlated with our mental health measures (a primary assumption of the intervention). We'll run it on the overall disaster preparedness measure and our cut-down version with only items with 95% or less 'yes' respondents.
